This extension is based on [Amatl](#), a binary tool that allows you to convert your Markdown files into HTML and PDF formats.

Transform your [CommonMark](#) (also known as [Markdown](#)) files into full-fledged documents from the command line.

Why the name `amatl`? Amate (Spanish: *amate* [a'mate], from Nahuatl languages: *āmatl* [ˈaːmat͡ɬ]) is a type of bark paper that has been manufactured in Mexico since pre-Columbian times. It was primarily used to create codices. **Source:** [Wikipedia](#)

1.0.1 = ✨ FEATURES

- Create documents from local or remote resources via URL resolving.
- Integrate [MermaidJS](#) diagrams and code blocks with syntax highlighting.
- Use [custom directives](#) to include other documents or generate tables of contents.
- Use [pre-defined or custom layouts](#) to transform your content into presentations, reports, etc.
- Use [Go templating](#) to inject dynamic data into your document.

1.0.1 = 🚀 HOW TO USE

⚠ **Caution** This project is in its early stages and subject to rapid evolution. Expect frequent changes and potential instability.

1. Download [the latest release](#) of `amatl`.
2. In your terminal, start transforming your documents into HTML:

```
amatl render html my-doc.md
```

See [doc](#) for more information.
